

## EUROFILE EQUIPMENT

The T204H telehandler from AUSA offers compact lifting performance

# Versatile load carriers

**THE LATEST** 2.5tonne capacity AUSA articulated rotating dumpers, D250AHGA and D250AHG, offer a high degree of stability and safety. Other features include high manoeuvrability and the ability to work in difficult spaces. The D250AHGA is equipped with a rotating hi-tip unloading system, significantly increasing productivity.

The machines have been designed for the Central European and Scandinavian

markets in particular. The hopper of the D250AHGA dumper has a scissor lift system that allows both frontal and lateral hi-tipping, although it can work with conventional equipment. Hopper capacity is 2,063litres although the machine also offers high stability when loaded due to its compact scissor lift system, wide lift channel, rear counterweight and safety system to prevent overloading. The D250AHG features

180° rotation of the skip while the D250AHGA has a hydraulic high-tip of 1.8m and skip rotation. In addition, AUSA's latest telehandler, the T204H, is a compact all terrain forklift truck with an extending boom, folding cab and hydrostatic transmission. The machine is less than 1.6m wide, offers full load capacity at a height of 4.2m and good all round visibility.

## Sophisticated site management

Topcon says that its advanced SiteLink technology provides a comprehensive information technology solution for equipment on construction sites.

The SiteLink product is a wireless communications mapping, data logging, reporting and asset management package that can be used on off-highway equipment. According to Topcon the system can be used with any make, model or type of job site machine, regardless of manufacturer and age.

The system can also pinpoint via GPS any make of equipment on a job site, serving as a built-in theft protection tool.

SiteLink was developed jointly by Topcon and TSD Integrated Controls, a joint venture company of Topcon and Sauer Danfoss, and because of the communications technology integrated into the package, a user has real-time access to equipment based in remote locations at all times.

Achiel Sturm, TEP product marketing manager for construction products at Topcon Europe said: "The machines can talk to each other as well as to the computers in the office."
